m-2 sec-1. The temperature was maintained at 20 degrees C with a 15-hr photoperiod under a relative humidity of 70%. After this period watering of plants was stopped. Four time points were sampled during a two week period; the first after wilting was observed and the last, two weeks later, consisted of live crown and leaf tissue (leaf tissue that was yellow was not included in sampled material). First strand synthesis in this library was done in the presence of methylated dCTP thereby protecting from internal cleavage with NotI."
